

Assignment No: 2 - Linear and Logistic Regression

- 1. Set A1 - Create 'sales' Data set having 5 columns namely: ID, TV, Radio, Newspaper and Sales.(random 500 entries) Build a linear regression model by identifying independent and target variable. Split the variables into training and testing sets. then divide the training and testing sets into a 7:3 ratio, respectively and print them. Build a simple linear regression model.**
- 2. Set A2 - Create 'realestate' Data set having 4 columns namely: ID,flat, houses and purchases (random 500 entries). Build a linear regression model by identifying independent and target variable. Split the variables into training and testing sets and print them. Build a simple linear regression model for predicting purchases.**
- 3. Set B1 - Build a simple linear regression model for Fish Species Weight Prediction. (download dataset <https://www.kaggle.com/aungpyaeap/fish-market?select=Fish.csv>)**
